

RECREATION UPGRADES

The City's Energy Team has also done a significant amount of work in the City's recreational facilities. These facilities can present great opportunities for savings through lighting and pool heating upgrades. The City is always looking to maximize community usability while progressing toward its energy efficiency goals.

Below are some examples of projects the the Energy Team has completed in some of the City's recreational facilities.

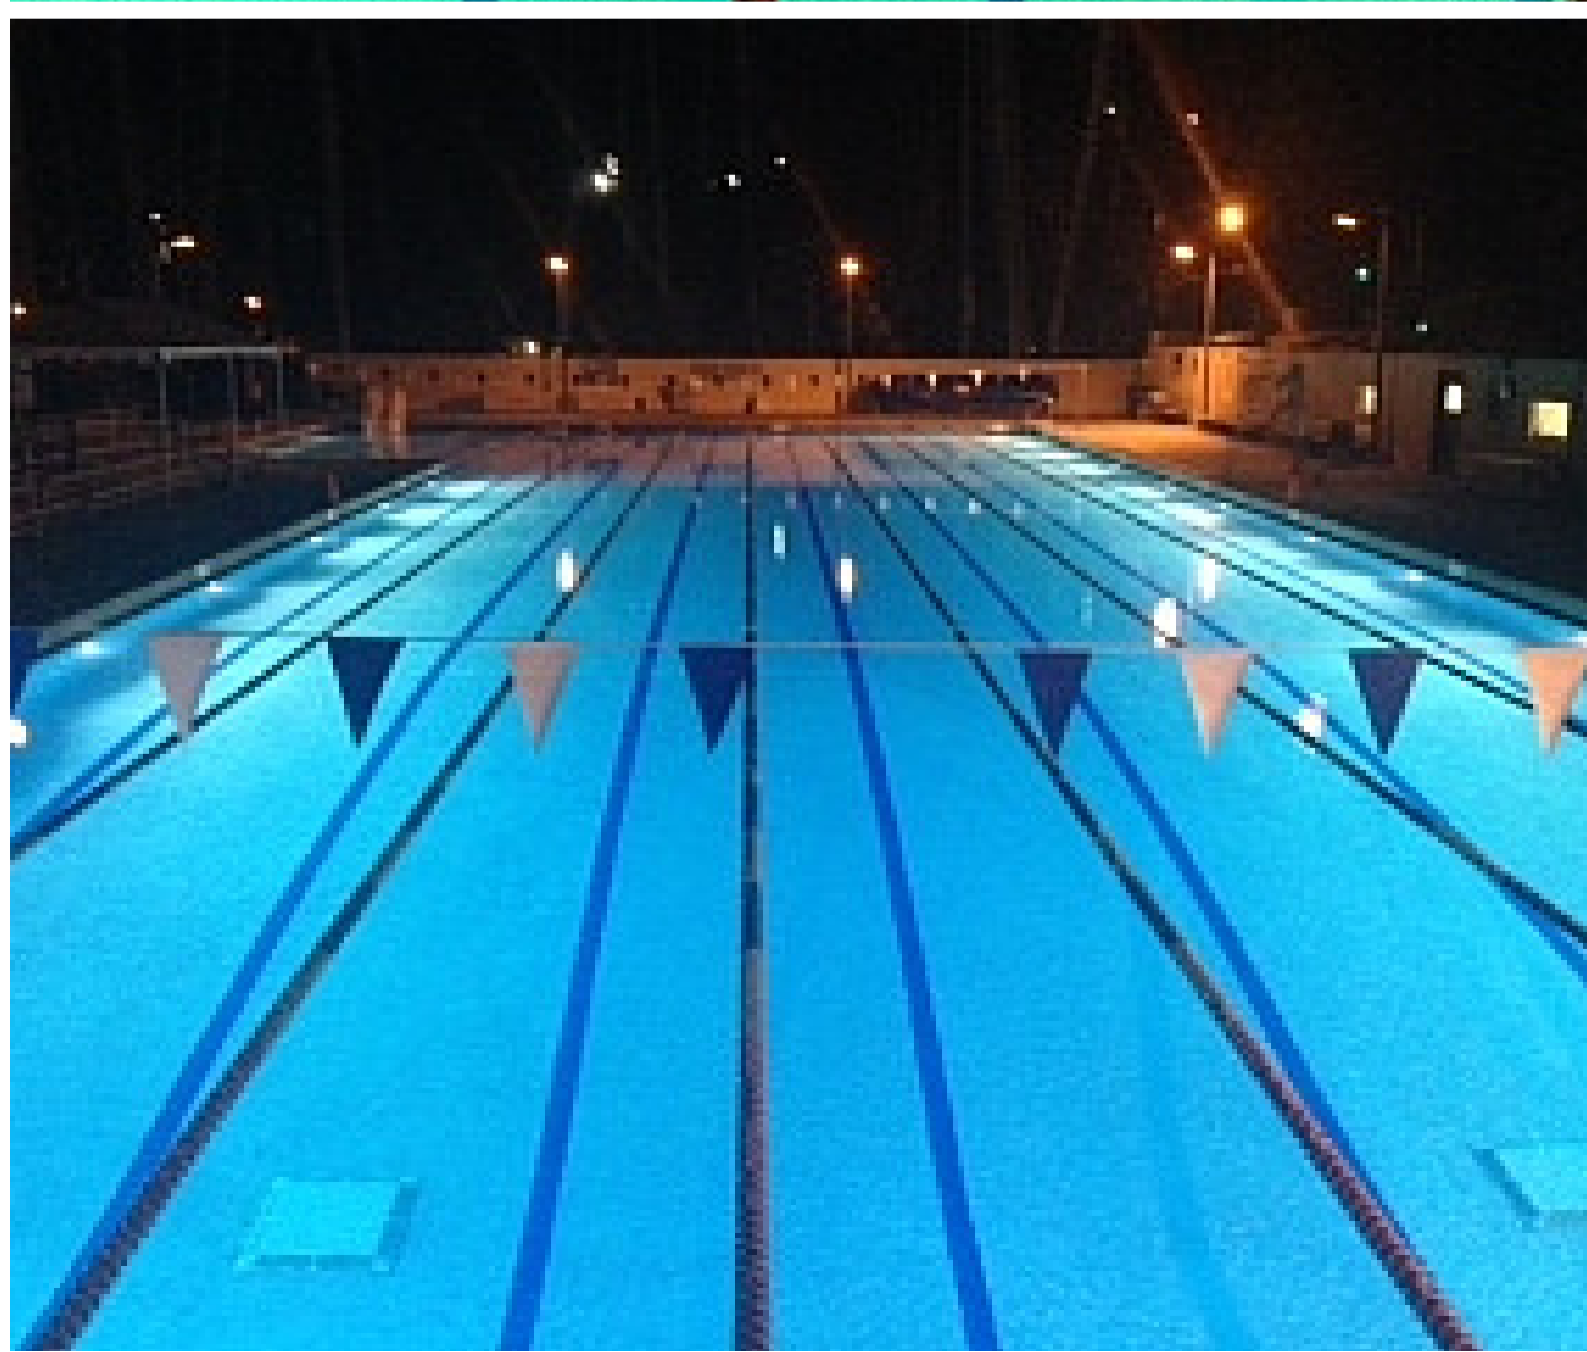

LED POOL LIGHTING

In 2014 The City replaced the inefficient incandescent lights in the Los Banos Del Mar pool with high efficiency LED lights.

The result was a significant increase in visibility in the pool as well as highly improved color rendering.

The project was 100% funded by On-Bill Financing (OBF) which means the City didn't put up any up front capital and pays the project off through savings acheived.

This project is projected to save the City \$2,300 per year!

HIGH EFFICIENCY BOILERS

The boilers at Los Banos were replaced in 2012. This was significant because Los Banos is the City's highest user of natural gas, largely due to pool heating.

These ultra-efficient boilers were also funded with OBF and are projected to save the City over \$7,000 per year through natural gas savings.

UPGRADED BALL FIELD LIGHTING

Over the past five years, the City has replaced much of the sports field lighting at City Ball Fields. Lighting replacements have been completed at Pershing Park, Cabrillo Ball Field, Dwight Murphy Ball Field and Ortega Park.

The result is more light on the field and significant costs and energy savings for the City's Parks & Rec Department.
